Lab 3 Report: JavaScript

Name: Rodina Mohamed

Student ID: 23P0191

GitHub: https://github.com/Rodina761/webDevelopments-lab-submissions-

This lab has two parts. The first is the cart page we did in the lab, and the second is the calculator from the lab task. Both use an HTML file, a CSS file and a separate JS file.

Part 1: Cart

The cart page keeps a quantity variable. Each button calls a function that changes the quantity (+1, +2, +3 or reset to 0) and writes it inside the result paragraph using textContent.

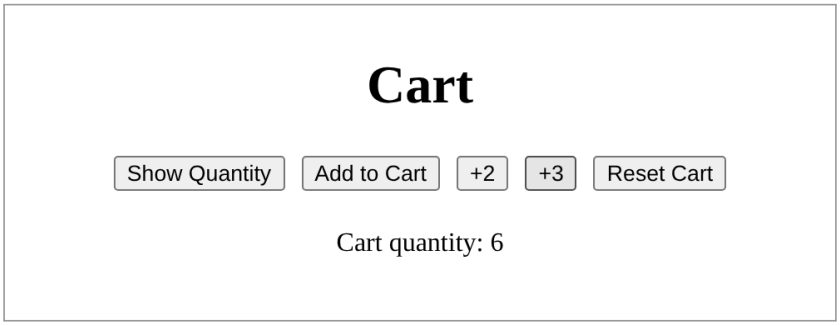

Figure 1: Cart page after pressing Add to Cart, +2 and +3

Part 2: Calculator

The calculator does addition, subtraction, multiplication and division, plus AC, 00, % and decimal point. One click listener on the buttons container reads the value of the clicked button (event delegation). The first number and the operator are saved, and when = is pressed the result is calculated. The small line above the number shows the operation, and dividing by zero shows Error.

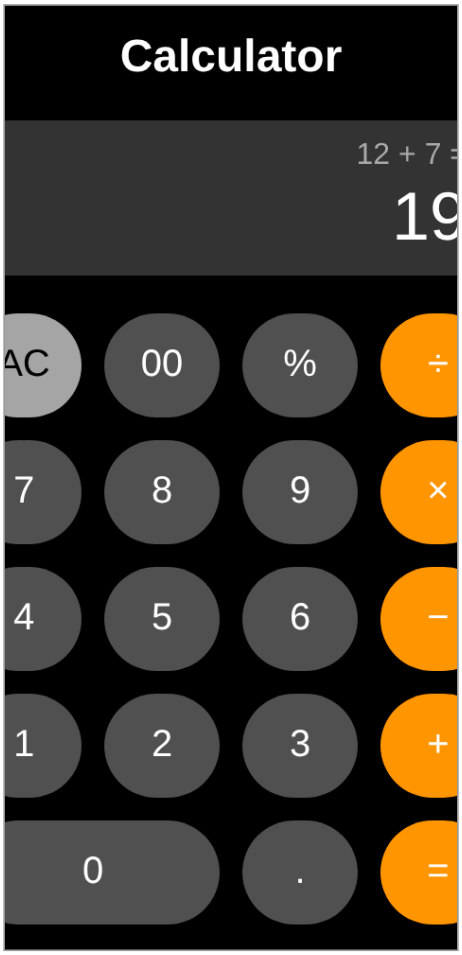

Figure 2: Calculator showing 12 + 7 = 19

Source files

- index.html, style.css, script.js: cart page
- calculator/index.html: calculator layout (display and buttons)
- calculator/style.css: dark iOS style, grid for the buttons
- calculator/script.js: click handling and the calculation
